

We will have a peer review process between students for the assignments; students can participate in the final exam once they complete this process.

Students should contact **Matteo Dell'Amico** (matteo.dellamico@unige.it) to agree on how to extend the simulators: your own proposal for a modification is more than welcome; otherwise, we will provide suggestions. This should be done well before the deadline, and won't be accepted later than **one week** before the deadline.

Your simulator extension should be based on a **research question**. For example: "Under which conditions is this modification more performant than the original?", or "Does introducing this new detail in the simulation impact the simulation outcomes?" Besides writing the code for the extension, you should think about which experiments will be needed to evaluate the answer to your research question and about the best way to show the results to answer your questions. For example, which plots to draw, and how to comment on them.

Once the extension you agreed to is completed, you can participate in the peer review process. At least once per month in which exams are allowed (January, February, June, July), there will be two deadlines for participating in an instance of the peer review process: a first one for submitting code and reports for the assignments, and a second one (generally, a week after the first one) for performing peer review.
