

The exam will be taken in two steps: a quiz on AulaWeb (to be taken in the labs, typically in SW2; there will be dates in January, February, June, July and September), and an oral examination. All students can take the quiz, whether or not they submitted the assignments.

### Assignments

The assignments can be completed alone or in groups of two people; for more detail see the [Assignment Peer Review Process](#) document.

### Final exam

Oral exams will be set up by appointment: students who have completed the assignments' peer review process and have a sufficient mark in the quiz can write to ask for an exam on the SSE forum (there will be opportunities in January, February, June, July and September), and we will try to find a date that works for everybody. You can pass the quiz and do your assignment peer reviews in different months, until September (afterwards, this is not guaranteed because the exam rules may change in the following year).

Students who complete the peer review process on the same date are encouraged to cluster and take the exam on the same date. Students who worked together on the assignment are encouraged to take the exam together, if possible. If only one passed the quiz, both can take the oral exam at the same time (the vote for such students will be registered after they successfully pass the quiz).

You should submit your assignment and code by the final exam date in the "final assignment submission" part. Your final submission should consider both the comments you received in the peer review and what you have learned by studying the work of others.

Exams are public, and all students are welcome to join as spectators.

The exam for this course revolves around the **presentation of the two assignments**, contributing to the final evaluation with the result of the written exam.

Try to present both assignments within 10 minutes (excluding additional examiner questions). It's probably a good idea to just go through the PDF during your presentation (i.e., no slides). You need to be able to explain the code of your group (and perform small on-the-fly modifications if asked), **even if it was written by your teammate**. You can organize the presentation as you wish, but it can be a good idea to present the document itself.

We will evaluate the activity in the peer review process as well. Students will be evaluated concerning both the quality of the review they gave to their peers and how they modified their assignment according to the peer review's comments.
